INDEX DESCRIPTION

The iSTOXX RiskFirst LDI Indices track the performance of GBP-denominated UK government and corporate bonds, and are optimized using RiskFirst's proprietary cash-flow matching model to reflect typical liability profiles of UK defined benefit pension schemes. Liability-driven investment (LDI) is an increasingly important concept for defined benefit pension schemes, which are seeking to hedge against interest rate and inflation risk by investing in solutions that closely match their liability cash flows.

The iSTOXX RiskFirst LDI index family comprises a range of indices based on 12 distinct profiles, capturing member type, duration, type of indexation (pre- and post-retirement), interest rate and inflation sensitivity and tax-free cash component of typical UK pension schemes.

The iSTOXX RiskFirst LDI Real Longer Pre RPI Post RPI Index comprises inflation-linked UK gilts, weighted according to RiskFirst's liability cash-flow profile targeted at deferred members of a UK defined benefit pension scheme with a longer duration and with RPI-linked pre- and post-retirement indexation.

KEY FACTS

- » Transparent and rules-based methodology provides independently calculated benchmarks for LDI portfolios.
- » A range of bond indices serve as common building blocks for tailored LDI solutions for UK defined benefit pension schemes.
- » RiskFirst's best-in-class matching model allows close tracking of typical liability profiles.
- » STOXX's real-time fixed income index calculation capabilities improve efficiency.
- » Rigorous bond selection ensures liquidity and tradability.

INDEX METHODOLOGY

Indices track either UK gilts or non-gilts (corporate bonds and other UK government bonds). Nominal indices are based on fixed-/zero-coupon bonds whereas real indices are based on inflation-linked bonds. The index family also includes blended indices, which are based on both nominal and real indices. To be eligible, bonds must have an investment grade rating, a time to maturity of at least 15 months measured from the rebalancing date and a minimum amount outstanding of GBP 500 million.

RiskFirst's cash-flow matching model then determines the weighting of index constituents to capture typical annual liability cash flows of UK pension schemes, optimized in line with the relevant cash-flow profile. For gilt-based indices, a minimum number of six bonds applies; individual weights are capped at 30% per bond. For non-gilt-based indices, individual weights are capped at 20% per issuer.

The indices are rebalanced quarterly.

BACK TESTED PERFORMANCE

This document contains index performance data based on back testing, i.e. calculations of how the index might have performed prior to launch if it had existed using the same index methodology and based on historical constituents. Back tested performance information is purely hypothetical and is provided in this document solely for information purposes. Back tested performance does not represent actual performance and should not be interpreted as an indication of actual performance.
